Report on Website builder tool for DeepBlue Informatics

1. SUMMARY

The constant growth phase of DeepBlue Informatics has led to realizing the importance of a better information management web portal in the organization for employees and customers. Standardization of the platform used across departments is another crucial factor to consider.

The report compares various tools and recommends one among Wix, Webflow, WordPress, and Weebly, which best suits our use case. The data source for this comparison is from the products and service providers who are the industry leaders in the market.

Considering the price, flexibility, and features WordPress offers, along with a decade-long string community, WordPress is the recommended choice, which prominently stands out and suits best for DeepBlue Informatics.

2. BACKGROUND/CONTEXT

Effective communication has become a crucial aspect at DeepBlue Informatics as we are constantly growing across the globe. Thus, translating to the need to have a better information management system for both customers and employees. A significant upside to having an information management system is that it reduces the workload on the marketing team. The most effective way to do the same would be to have a standard and shared website. Creating a web presence for the organization to maintain information can be helpful in numerous ways. It can target and attract new potential customers and assist existing customers better. It can effectively manage various events and standardize the source and format of information published across the organization. A web presence could be helpful to manage employee and company details like policies, claims, and benefits to maintain a healthy relationship with employees with an end goal to create a feeling of togetherness.

It's further essential to enforce a standard format across departments such as Finance, Marketing, and Human Resources, even if it means extra work to give up their favorite platforms and migrate to a new service altogether. Next, the plan is to choose a service provider for managing the content, keeping various criteria aligned with our requirements. Although driven by the operations team, easy integration across the departments, adaptation to the existing workflows, and reliable customer support are the top features to consider, along with offers to provide extensive training to the internal team. Other deciding factors to consider are the user interface and experience, pricing, and reviews on the software. Finally, the report aims to compare, analyze, and recommend the various website development tools available in the market for org-wide standardization.

3. DETAILS

Below are the details for WordPress, Wix, WebFlow, and Weebly, considering the ease of using the platform, integrations with third-party tools, customer, and training offerings.

Figure 1: WordPress, Wix, Webflow, and Drupal comparison [1]

3.1. WORDPRESS

WordPress is a free, open-source, and commonly used CMS (Content Management System) tool with more than 40% market share among the top 10 million websites on the internet [2]. The WordPress community is ever-growing and offers a wide range of features, and it is easy to extend the application for a variety of use-cases. WordPress can be self-hosted or opt to use the managed service that works on a subscription model. Some of the essential features of WordPress are as follows:

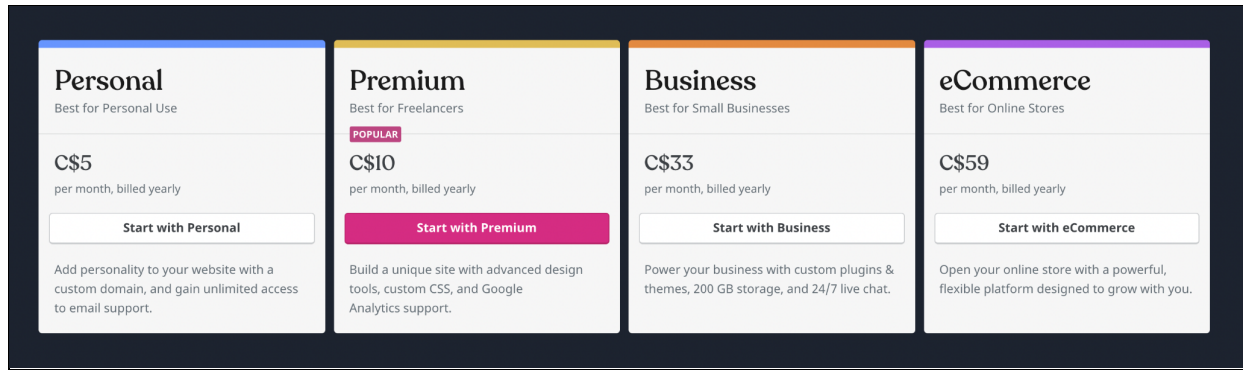

Figure 2: WordPress Features and Pricing [3]

Depending on the complexity of the web application and requirements, getting started with WordPress does not require any software development experience but requires understanding concepts such as themes, plugins, posts, pages, categories, tags, and more [4]. By default, WordPress has a website builder and theme/block editor for content management but has the flexibility to extend features, which would require web development experience in PHP.

WordPress has a solid open-source community; the real power of WordPress comes from its plugins [5] and themes available for free or for a reasonable price, making integrations with third-party applications and other use-cases an easy task. Furthermore, one can always build a custom plugin if necessary and contribute back to the community.

WordPress offers extensive customer support by opting for the managed service, where the priority and time taken for resolution depends on the subscription plan chosen. As of now, there are four plans available: Personal, Premium, Business, and eCommerce. In addition, WordPress has comprehensive step-by-step documentation [6], and the business plan has the flexibility to offer support for custom plugins, training and is available 24/7 across time zones.

3.2. WIX:

Wix is a website builder and is strongly bound to a subscription model for using the application. The free tier offers various basic features, such as a drag and drop website editor. It has gained popularity in the last few years because of its easy-to-use interface, making it a go-to platform for quick and hassle-free website setup, although it has been in the market since 2006. Another advantage of Wix is that all themes are mobile-friendly. Below are the crucial criteria considered for analysis:

Table 1: Wix Features and Pricing [7]

		VIP First Priority Support — CAD 36 ⁵⁰ /month	MOST POPULAR Unlimited Entrepreneurs & Freelancers — CAD 17 ⁵⁰ /month	Combo For Personal Use — CAD 12 ⁵⁰ /month	Connect Domain Most Basic © This Plan displays Wix ads CAD 6 ⁵⁰ /month

Customer care	①	Priority customer care	24/7 customer care	24/7 customer care	24/7 customer care

Especially for simple use-cases such as a blog or a website with minimal content management features, Wix has good customer reviews and ratings for its ease of using the platform and requires zero to no programming or web development experience. Wix

has a wide range of tools and plugins. The premium plan offers features like the mailbox, analytics, login, free website hosting, a custom domain name for the website, and a chat tool for connecting with people within an organization but does not accommodate self-hosting. Since it's not open source, the flexibility and ability to customize are limited compared to other alternatives.

The free and premium plan in Wix has minimal customer support; however, the business plan has 24/7 customer support with a high priority resolution and offers a one-on-one video session and comprehensive documentation, both in text and pre-recorded videos for training [8].

3.3. WEBFLOW:

Webflow is once again a website builder that offers a visual web design tool to make websites. It is SAAS (software as a service) product, the free tier has minimal features, and the paid plans include features, upgrades, and hosting services.

Table 2: Webflow Features and Pricing [9]

Website	Basic	CMS	Business	Enterprise
Save 15% on annual subscriptions	\$12 USD per month, paid annually, or \$15 paid monthly Best for a simple site that doesn't need a CMS.	\$16 USD per month, paid annually, or \$20 paid monthly Best for a blog or other content-driven site.	\$36 USD per month, paid annually, or \$45 paid monthly Best for a higher traffic marketing site or blog. API requests per minute ⓘ		60 RPM	120 RPM	Custom
Content editors ⓘ		3	10	Custom
Site search ⓘ		✓	✓	✓

Like other platforms, Webflow offers a visual editor but still has the same learning curve to provide more user-friendly features and better extensibility. Furthermore, it lacks native features such as comments and categorization. Lack of design elements makes it difficult for users without web development experience.

Webflow offers a limited number of third-party integrations such as google analytics for tracking website performance and Mailchimp for email subscriptions. However, the community is relatively small compared to other competitors and does not offer out-of-the-box integrations. Furthermore, the integrations may not be compatible in all hosting environments due to compatibility issues.

Only the enterprise subscription offers customer support as a service, but Webflow has an option to hire an expert for any assistance. However, the documentation is detailed and provides a range of tutorials for setting up the website and integrations.

3.4. WEEBLY:

With over 50 million users [10], Weebly has a range of in-built tools and features in both free and paid versions. However, it cannot be self-hosted, and it is mandatory to subscribe to a payment model to unlock all the features. While it's commonly used for blogs, portfolios, personal and event pages. The lack of developer community can be of concern as one may not hire a developer to extend any of the features.

Free	Personal	Professional	Performance
Basic use	Connect to a custom domain	Connect your domain and add more customization.	Add features that drive growth and manage operations.

		Phone Support	Phone Support
			Priority Support

Weebly is known for its simplistic visual editor, a drag and drop builder, making it very easy to use and beginner-friendly, not to mention the ease of customization on themes. Furthermore, the customizer works in real-time and does not require any prior software development experience. There are also hundreds of pre-made themes and templates with drag-drop functionality.

The primary focus of Weebly is on easy setup and integration, making integrations with supported tools and platforms a one-click feature. However, it lacks flexibility and does

not offer a wide range of integrations. In addition, Weebly being a managed service makes it much harder for further modifications to the application.

The performance plan in Weebly offers the best customer support, which also includes assistance for training. The best feature is that the support is available across platforms, such as email, phone, live chat, and community forum. However, the documentation is very minimal because of the user-friendly and minimalistic use of the application.

4. CONCLUSION

With the company's rapid growth worldwide, the need for a unified platform for sharing information across departments and delivering meaningful insights to customers is evident. Based on the recommendations from different departments on various viable tools for information management, the report compares WordPress, Wix, Webflow, and Weebly and concludes the following:

- The open-source self-hosted version of WordPress is highly flexible with an unlimited number of pages, posts, and subdomains. WordPress also has a proactive community and a plethora of themes and plugins on the marketplace.
- Wix is an easy-to-use drag and drop builder, making it very easy to use, and offers many out-of-the-box features such as a chatbox, subscription, and mailing service with dedicated support and helpline.
- Webflow is a web-based builder that generates HTML and javascript code based on the template created and is flexible to further modify the content as necessary with software development experience.
- Weebly is ideal for blogs and e-commerce applications with built-in tools to track users' activity and create custom templates.

5. RECOMMENDATIONS

Considering the use cases and flexibility DeepBlue Informatics, the recommendation to choose the right tool is as follows:

- The open-source, self-hosted version of WordPress is ideal, given the flexibility and the ability to extend to any number of sub-domains/departments. WordPress also offers a website builder taking away the need for development experience.
- Assign the initial set-up and minimal maintenance of WordPress to the development operations team at DeepBlue Informatics. Furthermore, set up a development version before the production version for employees within the organization to explore the product.
- Eventually, consider using the managed WordPress service if necessary, making it cost-effective depending on the usage.
- Circulate the report and documentation to emphasize the benefits of WordPress over other tools and receive feedback for further action items.
- In the best case, schedule a couple of training and information sessions and set up a sub-domain for every department for better information management.
